Aplicando Hopital:

$$f'(z_0) = \lim_{z \to 2} \frac{2-5}{2(2)} \iff \frac{-3}{4} \iff \boxed{\frac{3}{4}}$$

$$\begin{array}{c} (11) \lim_{\mathbf{z} \to 3\mathbf{i}} \frac{\mathbf{z}^4 + 10\,\mathbf{z}^2 + 9}{\mathbf{z}^2 - 4\,\mathbf{i}\,\mathbf{z} - 3} \end{array}$$

$$\lim_{z \to 3i} \frac{z^4 + 10z^2 + 9}{z^2 - 4iz - 3} = \frac{(3i)^4 + 10(3i)^2 + 9}{(3i)^2 - 4i(3i) - 3} = \frac{81i^4 + 90i^2 + 9}{9i^2 - 12i^2 - 3}$$

$$= \frac{81 - 90 + 9}{-9 + 12 - 3} = \frac{90 - 90}{12 - 12} = \frac{0}{0}$$

Usamos la regla de L'Hopital.

$$= \lim_{z \to 3i} \frac{4z^3 + 20z}{2z - 4i} = \frac{4(3i)^3 + 20(3i)}{2(3i) - 4i} = \frac{4(-27i) + 60i}{6i - 4i} = \frac{-108i + 60i}{2i} = \frac{-48i}{2i}$$

$$= \frac{-48i}{2i} \times \frac{-2i}{-2i} = \frac{96i^2}{-4i^2} = \frac{-96}{4} = -24$$

Derivadas

Conclusión:

La función f(z) = z Im(z) no es una función analítica, porque los puntos $z_0 = 1 + i$ y $z_0 = -2 - i$ sus límites $L_1 \neq L_2$ tomando 2 trayectorias diferentes; entonces no existe límite o derivada para los puntos anteriormente mecionados. Pero para el punto $z_0 = 0$ su límites $L_1 = L_2$ tomando 2 trayectorias diferentes; demuestra que exite límete unicamente en ese punto, por lo tanto tambien existe la derivada en dicho punto.

En los ejercicio (13) al (15) derive las siguientes funciones usando las Reglas de la diferencición (simplifique tanto como sea posible).

$$(13) \mathbf{f}(\mathbf{z}) = -5 \mathbf{z}^2 + \frac{2 + \mathbf{i}}{\mathbf{z}^2}$$

$$f(z) = -5z^{2} + (2+i)z^{-2}$$

$$f'(z) = -5(2z) + (2+i)(-2z^{-3}) = -10z - 2(2+i)z^{-3}$$

$$f'(z) = -10z - \frac{4+2i}{z^3}$$

$$(14) \mathbf{f}(\mathbf{z}) = (\mathbf{i} \, \mathbf{z}^2 + 3 \, \mathbf{z})^5$$

$$f'(z) = 5(iz^2 + 3z)^4 \cdot (2iz + 3)$$

(15)
$$\mathbf{f}(\mathbf{z}) = (\mathbf{z}^2 + 2\mathbf{z} - 7\mathbf{i})^2 (\mathbf{z}^4 - 4\mathbf{i}\mathbf{z})^3$$

$$f'(z) = 2(2z+2)(z^2+2z-7i)(z^4-4iz)^3+3(4z^3-4i)(z^2+2z-7i)^2(z^4-4iz)^2$$

$$f'(z) = (4z + 4)(z^{2} + 2z - 7i)(z^{4} - 4iz)^{3} + (12z^{3} - 12i)(z^{2} + 2z - 7i)^{2}(z^{4} - 4iz)^{2}$$

Ecuaciones de Cauchy-Riemann

En los ejercicio (16) al (20), use las Ecuaciones de Cauchy-Riemann para mostrar si las siguientes funciones complejas son o no Analíticas.

$$(16) \mathbf{f}(\mathbf{z}) = \mathbf{z}^2 + 5 \mathbf{i} \mathbf{z} + 3 - \mathbf{i}$$

$$f(z) = (x + iy)^{2} + 5i(x + iy) + 3 - i$$

$$f(z) = x^2 + 2xiy - y^2 + 5ix - 5y + 3 - i$$

$$u = x^2 - y^2 - 5y + 3$$
; $v = 2xy + 5x - 1$

Usamos la ecuaciones de C-R.

$$\frac{\partial u}{\partial x} = 2x$$

$$\frac{\partial v}{\partial y} = 2x$$

$$\frac{\partial u}{\partial y} = -2y - 5$$

$$-\frac{\partial v}{\partial x} = 2y + 5$$

$$\frac{\partial v}{\partial x} = -2y - 5$$
